

BULK STORAGE & DISPENSING SYSTEMS

HIGHLIGHTS

- Different configurations available
- Customizable

Unique color-coded tanks, available in 10 colors

Dedicated pump and filter set per tank

Dedicated suction hose per tank

Drip Pan

Spill Containment option

Introduction into Bulk Systems

Oil Safe®

Companies focus their fluid storage and handling practices around traditional containers that the fluids are typically delivered in - 55 gallon drums. The placement of the drums is usually ad hoc and disorganized, they consume valuable floor space, the handling requires specialized and expensive equipment and the delivered fluid cleanliness is rarely questioned or considered.

OIL SAFE Bulk Storage and Dispensing Systems provide best practice solutions for oil and fluids and delivers an orderly and well identified work place (**5S**) with in built filtration and spill containment options (**Lean**) to ensure that the right fluid is delivered to the right transfer container, in a clean state. When matched with LABEL SAFE they ensure that the users know what fluid they are handling (**Right to Know**).

For ease of purchasing the systems have two base configurations each of which are fully customizable:

- **Standard System** – space saving, economical configuration.
- **Advanced System** – best of class configuration with premium components and advanced contamination control.

Additional benefits of OIL SAFE Bulk Storage and Dispensing Systems include:

- **Heavy duty construction** provides long effective life and scalability.

- **65 gallon tanks** allows full 55 gallon drums to be transferred without the need to empty the tanks before hand. This ensures there is always some fluid available for use.

All systems ship in pre-assembled modules. Means no extra items to purchase and on site assembly is efficient.
